INEFFICIENT PREVENTIVE MAINTENANCE IN MECHANICAL SYSTEMS

Reducing downtime and costs with predictive monitoring

THE PROBLEM

Mechanical systems often rely on manual maintenance schedules, leading to unexpected breakdowns, high repair costs, and production delays.

WHY IT MATTERS

- Unexpected machine failure
- High repair costs
- Production downtime
- Safety risks

SOLUTION

Implement a sensor-based predictive maintenance system that monitors vibration, temperature, and usage in real time.

HOW IT WORKS

1. Sensors collect data (vibration, temp, usage)
2. Data sent to monitoring system
3. Software analyzes trends
4. Maintenance alerts generated

KEY BENEFITS

- Reduced downtime
- Data-driven decisions
- Predictive maintenance
- Improved efficiency
